

Error Patterns and Algorithms.

Below is the work of 12 fictional students. All of them are consistent in their work. Some of them are making consistent errors. That means, if there is the opportunity in the problem for them to make their ideosyncratic error, they will make it, though in some problems they make errors and in other problems of a slightly different type they get correct answers. Some of them have alternate algorithms that they are using (that yield the correct result in a reasonable way that is different from the standard algorithm). Try to get inside the head of each student and see if you can figure out what they are doing and why.

- Your task is to figure out what each student is doing and to do the same thing they would on the last two problems in each set. If they are doing something right, you should do the same right thing they are doing. If they are making an error, you should make the same error they would make.
- You then need to explain what they did in words: *what are they doing* and why: *is it an error or an alternate algorithm?* Try to use place value language to *describe why* their work is consistently in error or consistently works.
