

Math 246 Review 2:

1. Draw a bar diagram to show how to solve each of the following word problems, and write the associated equations:

- Addition and subtraction bar diagrams need labels
- Multiplicative comparison bar diagrams need labels
- Other multiplication and division bar diagrams do not need labels
- Each bar diagram needs an addition or multiplication equation (which may be a missing part equation)
- Some bar diagrams should also have a subtraction or division equation.

<p>a. Sandra had 4 erasers left after she gave 7 erasers to her friends. How many erasers did she start with?</p>  <p><math>7+4=?</math>    gave    has left optional: <math>?-7=4</math></p>	<p>b. Marie has 8 blue balloons and 5 red balloons. How many more red balloons than blue balloons does she have?</p>  <p><math>8-5=?</math> <math>5+?=8</math></p>
<p>c. Kyle has 9 transformers. He has 3 more than his sister. How many does his sister have?</p>  <p><math>9-3=?</math> <math>3+?=9</math></p>	<p>d. Amanda has 6 origami cranes. How many more does she need to make to have 10 origami cranes?</p>  <p><math>10-6=?</math> <math>6+?=10</math></p>
<p>e. Paul had 14 cookies. He gave some to his brother, and now he has 8. How many cookies did he give to his brother?</p>  <p><math>14-8=?</math> <math>8+?=14</math></p>	<p>f. A tootsie roll costs 4¢. Ross has 24¢. How many tootsie rolls can he buy?</p>  <p><math>24 \div 4 = ?</math> <math>4 \times ? = 24</math></p>

<p>g. A toy train can go 20 feet in 5 seconds. How many feet can it go in one second?</p> <div style="text-align: center;"> </div> <p> <math>20 \div 5 = ?</math>  <math>5 \times ? = 20</math> </p>	<p>h. A Jar of jam has 8 ounces of jam in it. How many ounces of jam are in 5 jars?</p> <div style="text-align: center;"> </div> <p> <math>8 \times 5 = ?</math> </p>
<p>i. John has 4 pencils. Nathan has <u>5 times as many</u> pencils <u>as</u> John. How many pencils does Nathan have?</p> <div style="text-align: center;"> </div> <p> <math>4 \times 5 = ?</math> </p>	<p>j. Kyle has 24 crayons. He has <u>3 times as many</u> crayons <u>as</u> Clara. How many crayons does Clara have?</p> <div style="text-align: center;"> </div> <p> <math>24 \div 3 = ?</math>  <math>3 \times ? = 24</math> </p>

2. Show **two ways** of doing each calculation that are **different from the standard algorithm**

a.  $36 + 29$

c.  $92 - 38$

(many correct solutions, including open number line, expanded, rounding and negative number solutions)

3. Explain (using appropriate base 10 language) the following two steps in the standard subtraction algorithm:

$$\begin{array}{r}
 6 \ 2 \ 8 \\
 - 2 \ 9 \ 3 \\
 \hline
 5
 \end{array}
 \Rightarrow
 \begin{array}{r}
 5 \ 12 \\
 \cancel{6} \ \cancel{2} \ 8 \\
 - 2 \ 9 \ 3 \\
 \hline
 5
 \end{array}
 \Rightarrow
 \begin{array}{r}
 5 \ 12 \\
 \cancel{6} \ \cancel{2} \ 8 \\
 - 2 \ 9 \ 3 \\
 \hline
 3 \ 5
 \end{array}$$

In the first step, I trade a hundred for 10 tens. Write down that there are now 5 hundreds (cross out 6), and there are now 12 tens (instead of 2).

In the second step, I take away 9 tens from 12 tens, which leaves 3 tens. Write 3 in the tens place of the answer.

4. Show how to solve each of these using the appropriate expanded algorithm:

a.  $478 + 394$    b.  $723 - 186$    c.  $246 \times 87$

$$\begin{array}{r}
 478 \\
 + 394 \\
 \hline
 12 \\
 160 \\
 \hline
 1200 \\
 1372 \\
 \hline
 \end{array}
 \quad
 \begin{array}{r}
 600 \\
 \cancel{700} \\
 - 100 \\
 \hline
 500 \\
 \end{array}
 +
 \begin{array}{r}
 110 \\
 \cancel{200} \\
 - 80 \\
 \hline
 30 \\
 \end{array}
 +
 \begin{array}{r}
 13 \\
 \cancel{200} \\
 - 6 \\
 \hline
 7 \\
 \end{array}
 = 537$$

$$\begin{array}{r}
 246 \\
 \times 87 \\
 \hline
 142 \\
 1280 \\
 1400 \\
 480 \\
 13200 \\
 16000 \\
 \hline
 21322
 \end{array}$$

5. Show how to solve the following problem using scaffolding division in a way that uses easier multiplication facts than the most efficient solution:

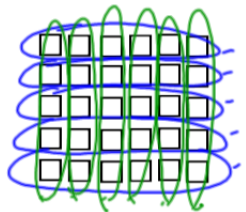

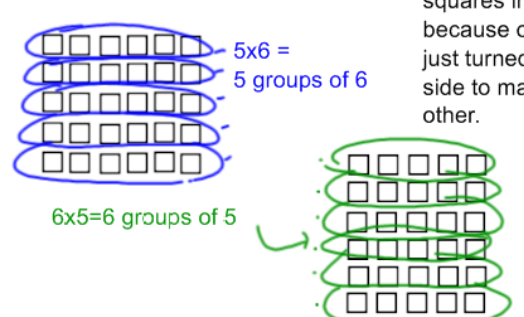

$8081 \div 12$

$$\begin{array}{r}
 \underline{673R5} \\
 12 \overline{)8081} \\
 \underline{4800} \quad 400 \\
 3281 \\
 \underline{2400} \quad 200 \\
 881 \\
 \underline{480} \quad 40 \\
 401 \\
 \underline{360} \quad 30 \\
 41 \\
 \underline{36} \quad \underline{3} \\
 5 \quad 673
 \end{array}$$

6. a. Explain how knowing the commutative law of multiplication helps children learn the multiplication facts

*It means that if a student knows one multiplication fact already (6x5), then they don't have to learn the turn-around fact (5x6) if they know the commutative law. It also lets them choose between two strategies/interpretations (5 groups of 6 or 6 groups of 5) to choose the one that they know best how to find the product.*

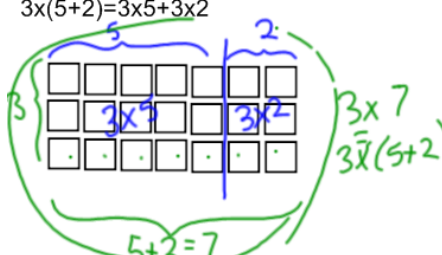

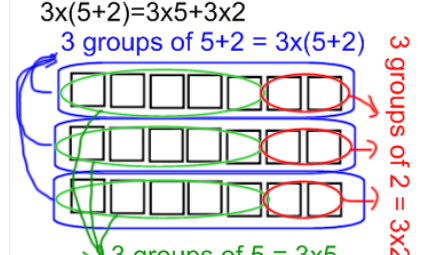

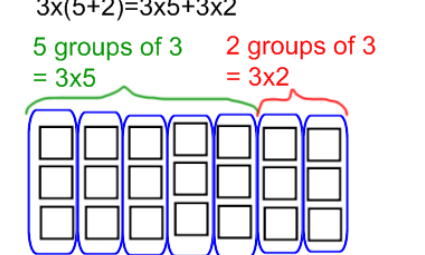

b. Draw a diagram and write an (in words) explanation that shows why the commutative law of multiplication makes sense (you may show it for a specific example)

<p>version 1: Commutative law: <math>a \times b = b \times a</math> <math>6 \times 5 = 5 \times 6</math></p>  <p><math>5 \times 6 =</math> 5 groups of 6</p> <p><math>6 \times 5 = 6</math> groups of 5</p> <p>6 groups of 5 and 5 groups of 6 are two ways of counting the same squares, so they are equal.</p>	<p>version 2: Commutative law: <math>a \times b = b \times a</math> <math>6 \times 5 = 5 \times 6</math></p>  <p><math>5 \times 6 =</math> 5 groups of 6</p> <p><math>6 \times 5 = 6</math> groups of 5</p> <p>These two arrays have the same number of squares in them because one is just turned on its side to make the other.</p> <p>6 groups of 5 and 5 groups of 6 are two ways of counting the same amount of squares, so they are equal.</p>
---	--

7. a. Explain how knowing the distributive law of multiplication over addition helps children learn the multiplication facts

*Children can break an unknown multiplication fact down into two known multiplication facts and add them together to find the total product*

b. Draw a diagram and write an (in words) explanation that shows why the commutative law of multiplication makes sense (you may show it for a specific example)

<p>version 1: Distributive Law <math>a(b+c) = ab+ac</math> <math>3 \times (5+2) = 3 \times 5 + 3 \times 2</math></p>  <p><math>3 \times 7</math> <math>3 \times (5+2)</math></p> <p><math>5+2=7</math></p> <p>The array for <math>3 \times (5+2)</math> can be split into two smaller arrays: <math>3 \times 5</math> and <math>3 \times 2</math>, so the number of squares in <math>3 \times (5+2)</math> is the same as the squares in <math>3 \times 5 +</math> the squares in <math>3 \times 2</math>.</p>	<p>version 2: Distributive Law <math>a(b+c) = ab+ac</math> <math>3 \times (5+2) = 3 \times 5 + 3 \times 2</math></p>  <p><math>3</math> groups of <math>5+2 = 3 \times (5+2)</math></p> <p><math>3</math> groups of <math>2 = 3 \times 2</math></p> <p><math>3</math> groups of <math>5 = 3 \times 5</math></p> <p>3 groups of 7 is the same amount as 3 groups of 5 and 3 groups of 2 because each 7 can be split into 5 and 2</p>	<p>version 3: Distributive Law <math>a(b+c) = ab+ac</math> <math>3 \times (5+2) = 3 \times 5 + 3 \times 2</math></p>  <p>5 groups of 3 = <math>3 \times 5</math></p> <p>2 groups of 3 = <math>3 \times 2</math></p> <p><math>5+2</math> groups of 3 = <math>3 \times (5+2)</math></p> <p>7 groups of 3 is the same as 5 groups of 3 and 2 more groups of 3</p>
---	---	---

8. Write **a.** a partition and **b.** a measurement division word problem for  $36 \div 4$ .

a. A partition division problem tells you the number of sets. For example “I have 36 cookies that I want to put equally into 4 bags. How many cookies should go in each bag?”

b. a measurement division problem tells you how many is in each set. For example: “I have 36 cookies. I want to put 4 cookies into each bag. How many bags can I fill?”

9. Write a word problem for  $32 \times 14$

Example: A shirt costs \$32. How much do 14 shirts cost?

10. Show how to compute  $438 \times 49$  using the lattice algorithm

11. a. Show how to compute  $\begin{array}{r} 548 \\ \times 37 \\ \hline \end{array}$  using the standard algorithm.

<p>a. Compute with the standard algorithm</p> $\begin{array}{r} 548 \\ \times 37 \\ \hline 3836 \\ 16440 \\ \hline 20276 \end{array}$	<p>b. Before computing <math>3 \times 8</math> in the standard algorithm we write a 0 in the partial product. Explain why we write a 0 there.  <i>3 is 3 tens, so the product should go in the tens place (24 tens), so we put a 0 in the ones place.</i></p>	<p>c. When we compute <math>3 \times 8 = 24</math> on the standard algorithm, we write 4 in the tens place, and we write 2 above the tens place. Why does 4 go in the tens place, and why does 2 go above the tens place?  <i>The 3 is 3 tens, so 24 is 24 tens, so 4 should go in the tens place (because it's 4 tens). The 2 is 20 tens = 200, so it needs to get added in the next place value. I'll get the next place value (hundreds) when I multiply <math>30 \times 40</math>, so I should put 2 above the 4 to make it easy to add on.</i></p>
---	---	---

12. a. Sketch an array diagram for:  $57 \times 82$

	<p>Notes about the array:            One side must have length <math>80+2</math>            The other side must have length <math>50+7</math>            The array must be subdivided into 4 parts where the numbers split between tens and ones.</p> <p>The lengths do not have to be to scale or even approximately to scale unless I provide a grid.</p>
<p>expanded:</p> $\begin{array}{r} 82 \\ \times 57 \\ \hline 14 \\ 560 \\ 100 \\ 4000 \\ \hline 4,674 \end{array}$	<p>standard:</p> $\begin{array}{r} 82 \\ \times 57 \\ \hline 574 \\ 4100 \\ \hline 4674 \end{array}$ <p>note that you could optionally choose to double color the 7 in 574 as red and purple, and the 1 in 4100 as blue and green.</p>

13. a. Write a division problem with a remainder where the answer that makes sense is the quotient  
 This needs to be a problem where it would make sense to discard the remainder: "I have 25 cookies. 4 cookies can fit in a bag. **How many bags can I fill?**"

b. Write a division problem with a remainder where the answer that makes sense is the quotient+1  
 This needs to be a problem where you have to keep and make a group for the remainder: "There are 25 children. 4 children can ride in each car. How many cars do we need **to take all of the children** to the zoo?"

14. Analyze and explain an error pattern or an alternate algorithm for addition, subtraction, multiplication or division.

15. Show two ways of figuring out  $4 \times 9$  using efficient strategies.

An efficient strategy is faster than skip counting ( $4+4+\dots+4$ ), but is not just a memorized answer.

<p>Focusing on the 4, and thinking of the problem as 4 groups of 9:</p> $\begin{array}{r} 4 \times 9 \\ \underline{2} \times \underline{9} \\ \text{Double twice:} \\ 9 \times 2 = 18 \\ 18 \times 2 = 36 \end{array}$	<p>Focusing on the 9, and thinking of the problem as 9 groups of 4:</p> $\begin{array}{r} 4 \times 10 = 40 \\ \text{(9 groups of 4)} \\ 4 \times 10 = 40 - 4 \\ \quad \quad = 36 \end{array}$ <p>(10 groups of 4 - 1 group of 4)  or use the 9's pattern: <math>4 \times 9</math> will have 3 as the tens digit (one less than 4). The tens and ones digits will add to 9: <math>3 + \underline{6} = 9</math> so 36.</p>
--	--

16. Show two ways of figuring out  $6 \times 7$  using efficient strategies.

<p>Thinking 6 groups of 7, and breaking 6 into 5 and 1:</p> <p><math>6 \times 7 =</math>          Six sevens  <math>5 \times 7 = 35</math>          five sevens  <math>35 + 7 = 42</math>          5 + 1 sevens</p>	<p>6 groups of 7, and <math>6 = 2 + 2 + 2</math></p> <p>2 sevens 3 times  <math>14 \quad 14 \quad 14</math>  <math>28</math>  <math>42</math></p>	<p>6 groups of 7 and <math>6 = 3 + 3</math></p> <p><math>3 \times 7 + 3 \times 7</math>  <math>21 + 21</math>  <math>42</math></p>	<p>7 groups of 6 and <math>7 = 5 + 2</math></p> <p><math>6 \times 7</math>          Seven sixes          five sixes = <math>5 \times 6 = 30</math>  <math>+ 2</math> sixes = <math>\frac{12}{42}</math></p>
---	---	--	---

17. a. Show what a direct modeling type picture (so you could count each object to find the answer) of a partitive division solution for  $19 \div 5$  would look like.

*partitive means 5 is the number of sets*

b. Show what a direct modeling type picture (so you could count each object to find the answer) of a ~~partitive~~ measurement division solution for  $19 \div 5$  would look like. (one of these should have been measurement).

*measurement means the 5 is the size of each set*

18. In the standard division algorithm as done with base 10 blocks:

$$\begin{array}{r}
 458 \\
 \hline
 4 \overline{) 1834} \\
 \underline{16} \phantom{0} \\
 23 \phantom{0} \\
 \underline{20} \phantom{0} \\
 34 \\
 \underline{32} \\
 2
 \end{array}$$

a. What does 5 represent?

*5 is the number of tens in each group*

b. What does 23 represent?

*23 is the number of tens left at this point in the process (waiting to be shared into the groups)*

c. What does 20 represent?

*20 is the total number of tens put into groups*

d. What does 34 represent?

*34 is the number of ones left (waiting to be put into groups)*

19. In this pattern, we are looking for the number of toothpicks it takes to build a stage  $n$  design. Find and carefully explain an equation for the pattern:

*Things to show: how to group the objects in similar ways in each pattern. (Label how many are in the groups)*

At each step ( $n$ ) there are  $n$  sets of 5 toothpicks that make most of a hexagon, so there are  $5n$  toothpicks in the red circled part.

*Explain in a sentence the repeated sets (\_\_\_ sets of \_\_\_)*

At each step there are 4 extra toothpicks that make a square (the blue circled part).

*Explain in a sentence the extras that are the same at each step.*

In all there are  $5n+4$  toothpicks at step  $n$

*Write the whole equation down. (If you color code things you are more likely to get full credit even if some detail is missing from your sentences.)*
