

The procedure we're following for these problems is to:

- organize the information and put it in a table, organized by units
- look at the table by units, and make a bar or a number line for the unit that you know two numbers for. If one of the two known numbers is 1, use a bar diagram. If neither of the known numbers is 1, find a common denominator and use number lines.
- add the information for the other unit into the diagram, and solve either with a second number line or by multiplying by appropriate unit fractions and whole numbers.

1. A can holds $1\frac{2}{3}$ cups of tomato sauce. How much tomato sauce is in $1\frac{1}{4}$ cans?

1 can = $1\frac{2}{3}$ cups	$1\frac{2}{3}$ cups	? cups
? cups = $1\frac{1}{4}$ cans	1 can	$1\frac{1}{4}$ cans

To find \square

$$1\frac{2}{3} \div 4 = \frac{5}{3} \times \frac{1}{4} = \frac{5}{12} \text{ c.}$$

To find ? : $\frac{5}{12} \times 5 = \frac{25}{12} = 2\frac{1}{12} \text{ c.}$

2. I have $\frac{3}{4}$ liters of soda. That's $\frac{2}{3}$ of a serving. How much soda is in one serving?

have $\frac{3}{4}$ l.	$\frac{3}{4}$ l.	? l.
$\frac{3}{4}$ l. = $\frac{2}{3}$ serv	$\frac{2}{3}$ serv	1 serv.
? l. = 1 serv		

To find \square :

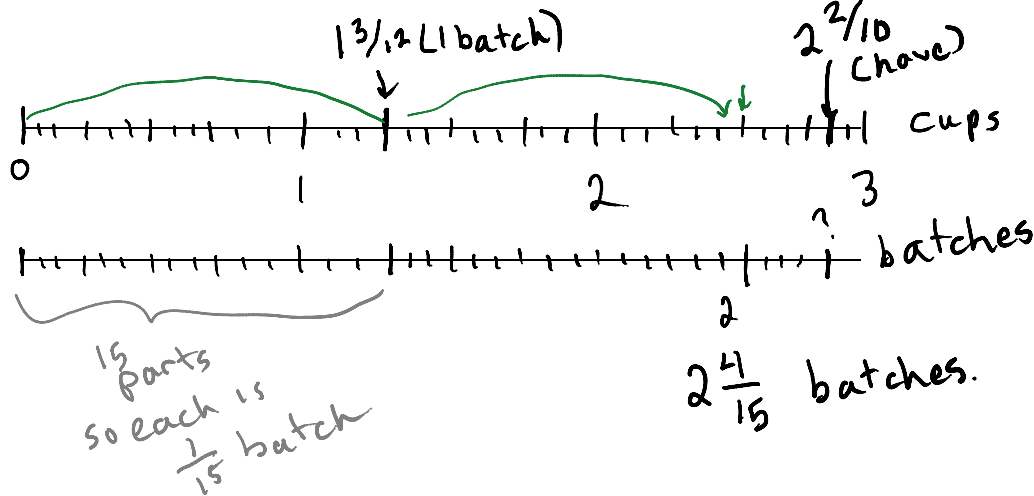

$$\frac{3}{4} \div 2 = \frac{3}{4} \times \frac{1}{2} = \frac{3}{8} \text{ l.}$$

To find ? : $\frac{3}{8} \times 3 = \frac{9}{8} \text{ l.}$
 $= 1\frac{1}{8} \text{ l.}$

3. I have $2\frac{5}{6}$ cups of pancake mix. A batch takes $1\frac{1}{4}$ cups of mix. How many batches of pancakes can I make?

I have $2\frac{5}{6}$ cups.	$2\frac{5}{6}$ cup	$1\frac{1}{4}$ cup
1 batch = $1\frac{1}{4}$ cup	? batches	1 batch
I have = ? batches		

Because we have two different fractional amounts of cups, we need a common denominator next: $2\frac{5}{6} = 2\frac{10}{12}$;
 $1\frac{1}{4} = 1\frac{3}{12}$

4. I have $2\frac{2}{3}$ yards of string. That's enough to go around the table $1\frac{1}{2}$ times. How many yards of string do I need to go around the table once?

I have $2\frac{2}{3}$ yards.	$2\frac{2}{3}$ yd	? yd
$2\frac{2}{3}$ yards = $1\frac{1}{2}$ tables	$1\frac{1}{2}$ table	1 table
? yards = 1 table		

To find \square :
 $2\frac{2}{3} \div 3 = \frac{8}{3} \times \frac{1}{3} = \frac{8}{9}$ yd

To find ? : $\frac{8}{9} \times 2 = \frac{16}{9}$ yd.
 $= 1\frac{7}{9}$ yd.

$1\frac{1}{2}$ times around table

5. A tube of paint holds $1\frac{1}{3}$ ounces. How much paint is in $\frac{2}{3}$ of a tube of paint?

1 tube = $1\frac{1}{3}$ oz	$1\frac{1}{3}$ oz	? oz
? oz = $\frac{2}{3}$ tube	1 tube	$\frac{2}{3}$ tube

To find \square :
 $1\frac{1}{3} \div 3 = \frac{4}{3} \times \frac{1}{3} = \frac{4}{9}$ oz.

To find ? : $\frac{4}{9} \times 2 = \frac{8}{9}$ oz

$\frac{2}{3}$ 1 tube

6. I have $\frac{2}{3}$ cups of soda. A serving is $\frac{3}{4}$ cup. How many servings do I have?

I have = $\frac{2}{3}$ cup	$\frac{2}{3}$ cup	$\frac{3}{4}$ cup
1 serving = $\frac{3}{4}$ cup	? serv	1 serv.
I have = ? servings?		

2 denominators, same unit: find common denominator: $\frac{2}{3} = \frac{8}{12}$; $\frac{3}{4} = \frac{9}{12}$

7. I have $2\frac{1}{2}$ yards of fabric. It takes $\frac{2}{3}$ yard of fabric to make a cub scout flag. How many flags can I make?

I have = $2\frac{1}{2}$ yds	$2\frac{1}{2}$ yds	$\frac{2}{3}$ yd
$\frac{2}{3}$ yd = 1 flag	? flags	1 flag
I have = ? flags		

2 denominators, same unit: find common denominator: $\frac{2}{3} = \frac{4}{6}$; $2\frac{1}{2} = 2\frac{3}{6}$

8. A bag of candy weighs $1\frac{1}{2}$ lbs. How much does $\frac{3}{5}$ of a bag of candy weigh?

1 bag = $1\frac{1}{2}$ lbs	$1\frac{1}{2}$ lbs	? lbs
? lbs = $\frac{3}{5}$ bag	1 bag	$\frac{3}{5}$ bag

$$\square = 1\frac{1}{2} \div 5 = \frac{3}{2} \times \frac{1}{5} = \frac{3}{10} \text{ lb}$$

$$? = \frac{3}{10} \times 3 = \frac{9}{10} \text{ lb}$$

9. I have $2 \frac{1}{3}$ cups of water. That fills the jar $\frac{5}{8}$ of the way full. How much water would it take to fill the jar?

I have = $2 \frac{1}{3}$ cup	$2 \frac{1}{3}$ cup	? cups
$2 \frac{1}{3}$ cup = $\frac{5}{8}$ jar	$\frac{5}{8}$ jar	1 jar
? cups = 1 jar		

$$\square = 2 \frac{1}{3} \div \frac{5}{8}$$

$$= \frac{7}{3} \times \frac{8}{5} = \frac{56}{15}$$

$$? = \frac{56}{15} \times 8 = \frac{56}{15} = 3 \frac{11}{15} \text{ c.}$$

10. A bottle has $\frac{2}{3}$ of a quart of juice in it. How much juice is in $2 \frac{1}{5}$ bottles?

1 bottle = $\frac{2}{3}$ quart	$\frac{2}{3}$ quart	? quarts
? quart = $2 \frac{1}{5}$ bottle	1 bottle	$2 \frac{1}{5}$ bottles

$$\square = \frac{2}{3} \div \frac{1}{5} = \frac{2}{3} \times \frac{1}{5} = \frac{2}{15}$$

$$? = \frac{2}{15} \times 11 = \frac{22}{15} = 1 \frac{7}{15} \text{ qts}$$

11. I have $2 \frac{1}{2}$ ounces of dye. It takes $\frac{3}{5}$ ounce of dye to dye 1 yard of fabric. How many yards of fabric can I dye?

I have = $2 \frac{1}{2}$ oz	$2 \frac{1}{2}$ oz	$\frac{3}{5}$ oz
$\frac{3}{5}$ oz = 1 yard	? yds	1 yd
? yards = me?		

$$2 \frac{1}{2} = 2 \frac{5}{10}$$

$$\frac{3}{5} = \frac{6}{10}$$

$$0 = \frac{1}{10} \text{ oz} = \frac{1}{6} \text{ yd}$$

$$4 \frac{1}{6} \text{ yds}$$

12. I have $2\frac{1}{4}$ pounds of apples. That's enough to make $1\frac{3}{5}$ jars of applesauce. How many apples do I need for 1 jar of applesauce?

I have = $2\frac{1}{4}$ lbs	$2\frac{1}{4}$ lbs	? lbs
$2\frac{1}{4}$ lbs = $1\frac{3}{5}$ jars	$1\frac{3}{5}$ jars	1 jar
? lbs = 1 jar		

fixed!

$$\square = 2\frac{1}{4} \div 8 = \frac{9}{4} \times \frac{1}{8} = \frac{9}{32}$$

$$? = \frac{9}{32} \times 5 = \frac{45}{32} = 1\frac{13}{32} \text{ lbs}$$

$1\frac{13}{32}$ lbs

13. Alice solved the problem:

Jan has 20 ounces of dried thyme. If a package of thyme weighs $\frac{3}{4}$ of an ounce, how many packages of thyme can Jan make?

by dividing: $20 \div \frac{3}{4} = 20 \times \frac{4}{3} = \frac{80}{3} = 26\frac{2}{3}$

What does 26 tell about the answer? What does $\frac{2}{3}$ tell about the answer?

She can make 26 full packages, and fill another package $\frac{2}{3}$ of the way full.

14. John solved the problem $\frac{5}{4} \div \frac{1}{3}$ by drawing the following diagram:

John says that this means that the answer is $3\frac{1}{4}$. Is he correct? If not, what is the correct answer, and how does it fit with his picture?

If this were a word problem, then the answer could be 3 with $\frac{1}{4}$ of a unit left over. Since this isn't a word problem, his answer isn't correct: there are 3 groups of $\frac{1}{3}$ and $\frac{3}{4}$ of another group (each group has 4 small parts in it), so the answer should be $3\frac{3}{4}$.
